

REPORT WEB DATAMANING & SEMANTICS

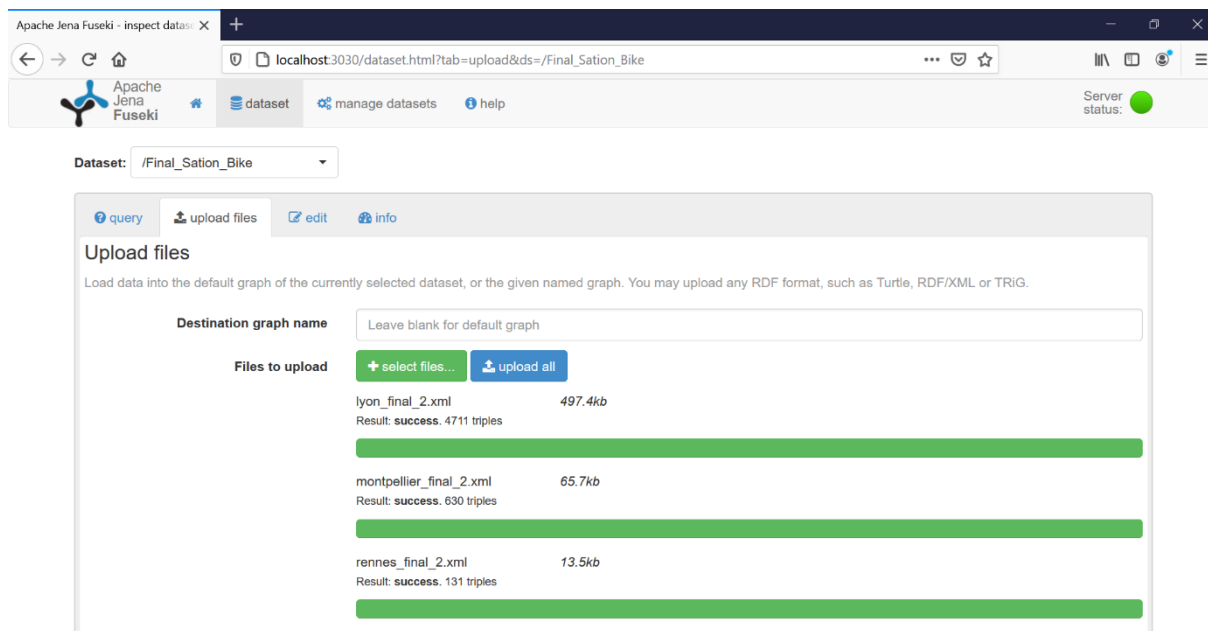

I/ How to Install and to use

First of all, you have to download our files on github (link here:

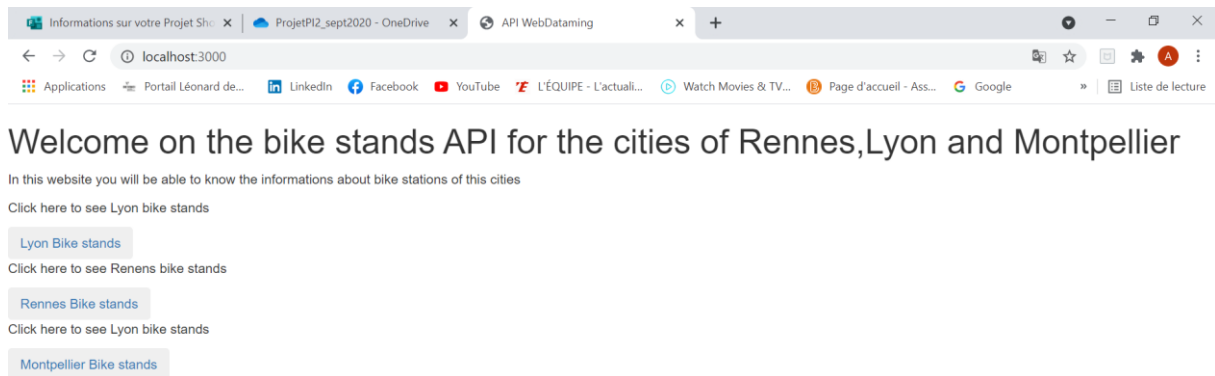

<https://github.com/ArthurVarez/DataMiningStands>) , then download apache-jena-fuseki et launch it by typing “fuseki-server.bat” in your command shell . You should have that:

Install firefox if you don't have it on your computer et go to localhost:3030, Fuseki should be here. Create a new dataset name “Final_Station_Bike” and import all the xml's files.

Then, go to the file api.py, open it and run it. Type localhost:3000 on your browser and got it !

Here is an example of the map of the Bike's stations :
